## 1. Introduction to the Case Study

Learning new skills online has become very common. However, many online courses are very long and people often do not complete them. Because of this, short courses that focus on specific skills are becoming more popular.

This case study presents **Learn Mint**, a micro-course marketplace website. The platform allows users to explore short courses, watch lesson videos, and track their progress.

The website is built using **HTML, CSS, and JavaScript**. It demonstrates how a multi-page responsive website can be created with features such as course listing, lesson modules, instructor information, and progress tracking.

## 2. Problem Statement / Case Background (Abstract)

### Background

Many learners want to learn a skill quickly without going through very long courses. A platform that provides short and focused learning modules can help users learn more efficiently.

### Abstract

The goal of this case study is to design and develop **LearnMint**, a responsive micro-course marketplace website. The system allows users to browse courses, view course details, watch lesson videos, and track their learning progress.

The platform includes multiple pages such as a homepage, courses page, course detail page, dashboard, and pricing page. JavaScript is used to handle features like lesson unlocking and progress calculation.

This project shows how basic web technologies can be used to build a simple learning platform.

## 3. Case Study Design

The LearnMint platform is designed as a **multi-page responsive website** where users can explore micro-courses and track their learning progress. The system consists of the following pages:

### Home Page (index.html)

The home page acts as the landing page of the platform. It includes the hero section, statistics section, featured courses, skill categories, and instructor section. Users can navigate to courses and pricing from this page.

### Courses Page (courses.html)

This page displays all available courses in a grid layout. Each course card shows the course title, image, duration, rating, and price. Users can click on a course to view more details.

### Course Detail Page (course.html)

This page shows detailed information about a selected course. It includes lesson modules, a video player for lessons, instructor information, and an option to enroll in the course.

### Dashboard Page (dashboard.html)

The dashboard allows users to see the courses they have enrolled in and track their learning progress using progress bars.

### Pricing Page (pricing.html)

This page displays pricing plans and bundle discounts using a comparison table.

### Login Page (login.html)

This page allows existing users to sign in to their account by entering their email and password.

### Signup Page (signup.html)

This page allows new users to create an account by providing their basic information.

All pages share a **common navigation bar and footer**, which provides consistent navigation across the platform

## 4. Methods & Algorithms Technology Applied in the Problem Statement / Case Study

The LearnMint platform is developed using basic **front-end web technologies**. These technologies are used to build the structure, design, and functionality of the website.

- **HTML (HyperText Markup Language)**

  HTML is used to create the structure of the website pages. Semantic tags such as **header, nav, section, article, and footer** are used to organize the layout of the pages.

  HTML is also used to create elements such as:

  - Course cards
  - Lesson module lists
  - Pricing tables
  - Navigation menus
  - Forms for login and signup

  These elements help display the content in a structured way.

- **CSS (Cascading Style Sheets)**

  CSS is used to design the user interface and make the website visually appealing. It controls the layout, colors, spacing, and responsiveness of the website.

  The following CSS techniques are used in the project:

  - **Flexbox** for navigation bars and card layouts
  - **CSS Grid** for displaying courses in a grid format
  - **Box shadows and border radius** for card styling
  - **Hover effects and transitions** for interactive elements
  - **Sticky navigation bar** for better user experience

CSS is also used to design the **progress bar that shows course completion**.

- **JavaScript**

  JavaScript is used to add interactive features to the website.

  The following functionalities are implemented using JavaScript:

  - Lesson unlocking after completing previous lessons
  - Progress bar updates based on completed lessons
  - Enrollment validation before accessing course lessons
  - Displaying completion message after finishing a course
  - Mobile menu toggle for responsive navigation

  JavaScript functions and event listeners are used to handle user actions and update the interface dynamically.

- **Technology Stack**

  The technologies used in this project include:

  - **HTML5** for page structure
  - **CSS3** for styling and layout
  - **JavaScript** for functionality and interactivity

The project is developed using a standard web development environment such as **VS Code and a web browser** for testing.

## 5. Problem Statement / Case Study Implementation Details and Snapshots

The LearnMint platform is implemented as a **multi-page front-end website** using HTML, CSS, and JavaScript. The project is organized into different files where each file handles a specific part of the system.

- ### Project Files

  The main files used in the project are:

  - ➔ **index.html** – Homepage of the platform
  - ➔ **courses.html** – Displays the list of available courses
  - ➔ **course.html** – Shows detailed information about a selected course and lesson modules
  - ➔ **dashboard.html** – Displays enrolled courses and learning progress
  - ➔ **pricing.html** – Shows pricing plans and bundle discounts
  - ➔ **login.html** – Page for existing users to sign in
  - ➔ **signup.html** – Page for new users to create an account

  The project also includes:

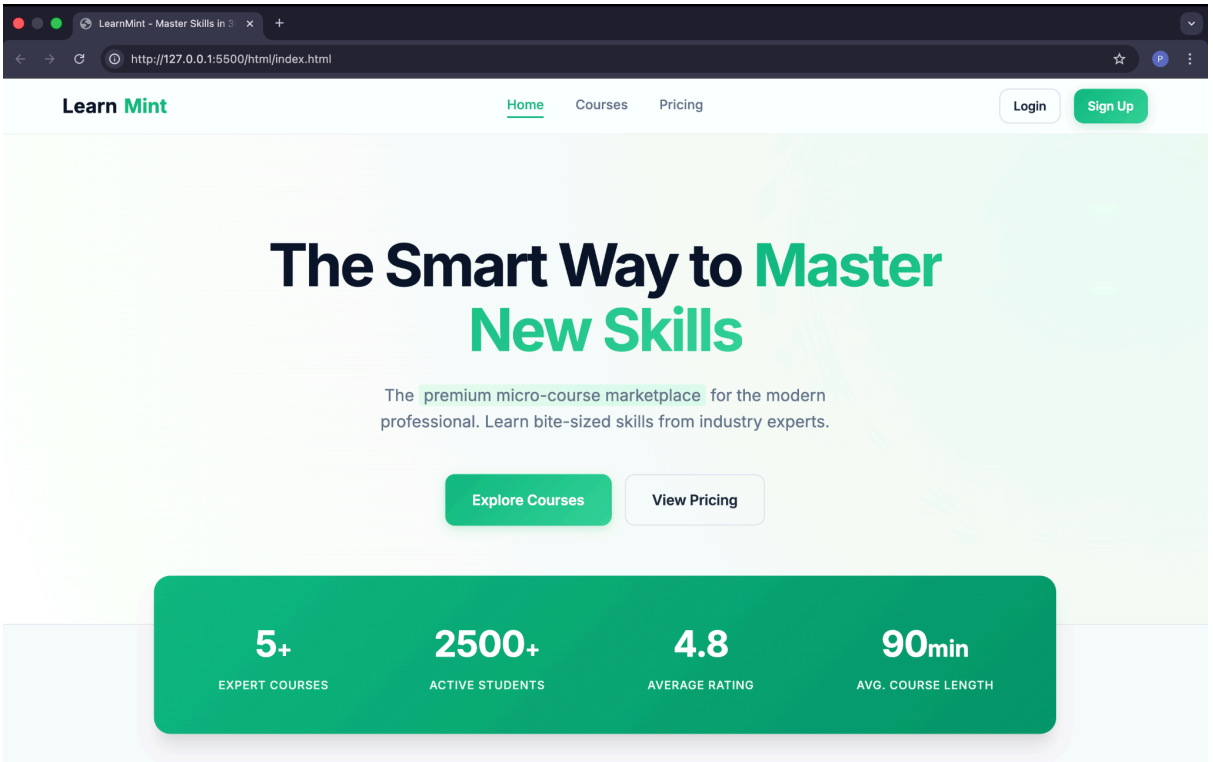
  - ➔ **style.css** – Contains styling for layout, colors, cards, and responsiveness
  - ➔ **app.js** – Handles interactive functionality such as lesson unlocking, progress updates, and navigation behavior
  - ➔ **data.js** – Stores course data, lesson details, and instructor information used across the website

- **Key Features Implemented:**

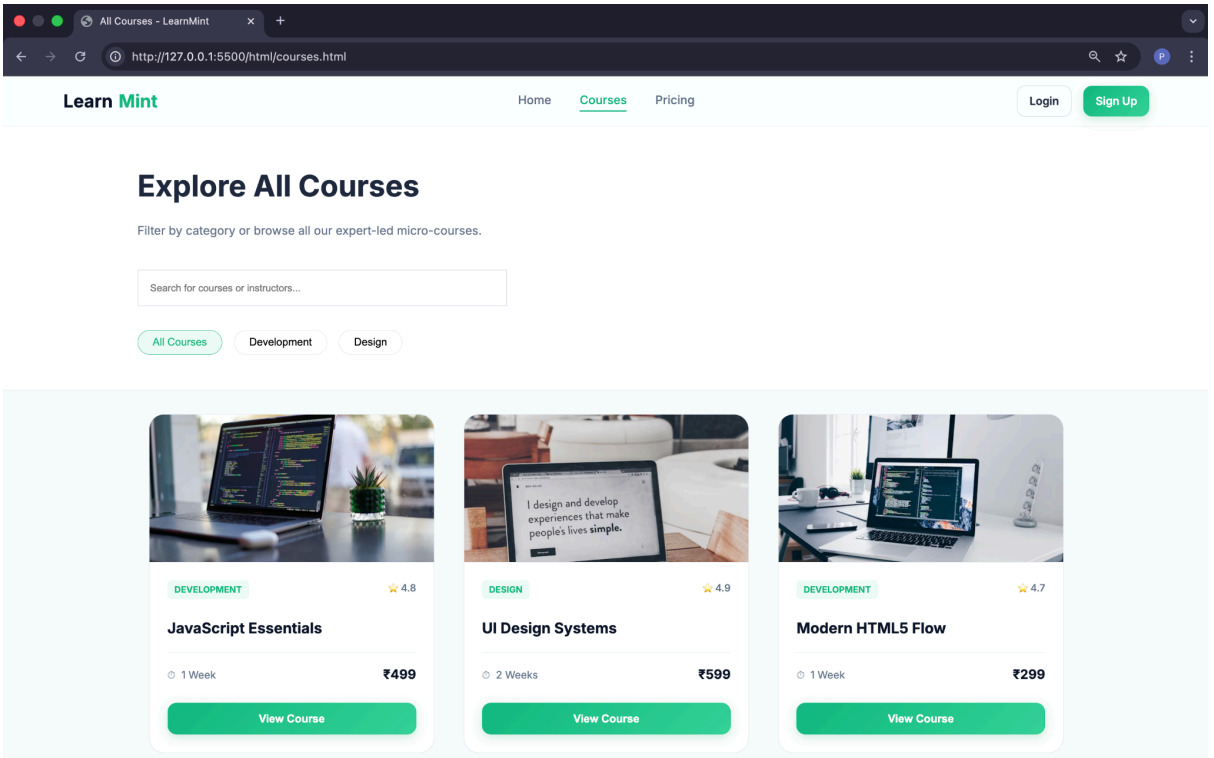
➔ The following features are implemented in the system:
➔ Course cards showing course title, duration, rating, and price
➔ Lesson module list for each course
➔ Embedded YouTube video player for lesson content
➔ Instructor information displayed on course pages
➔ Progress tracking using a progress bar
➔ Sequential lesson unlocking using JavaScript logic
➔ Responsive navigation menu for mobile devices
➔ User login and signup interface
➔ These features help create a structured micro-learning experience for users.

## Snapshots

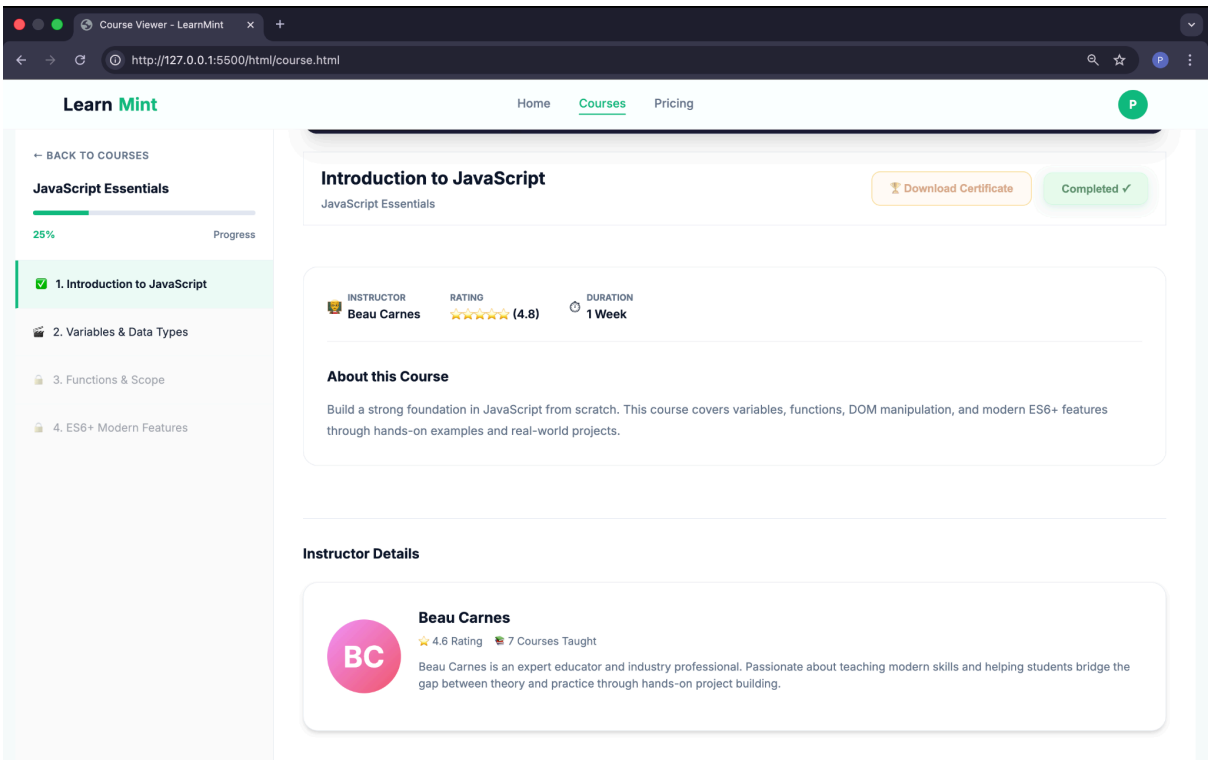
1. Homepage



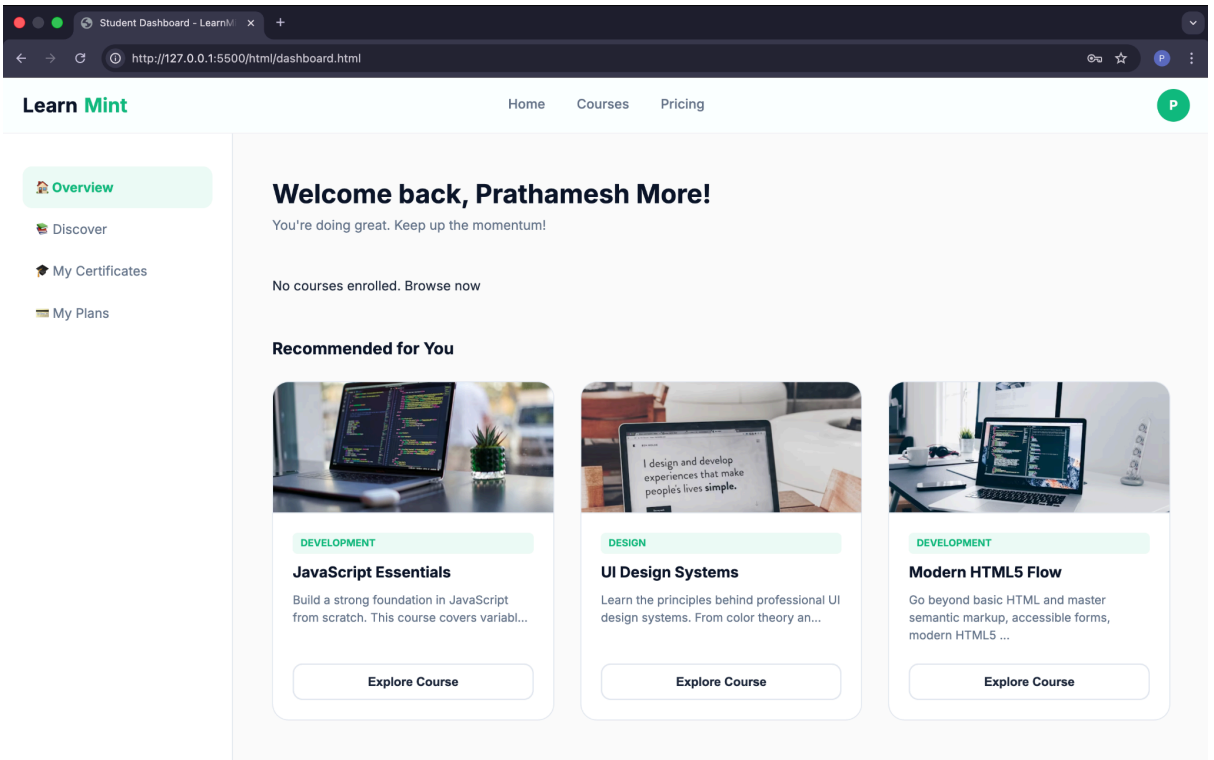
2. Courses page



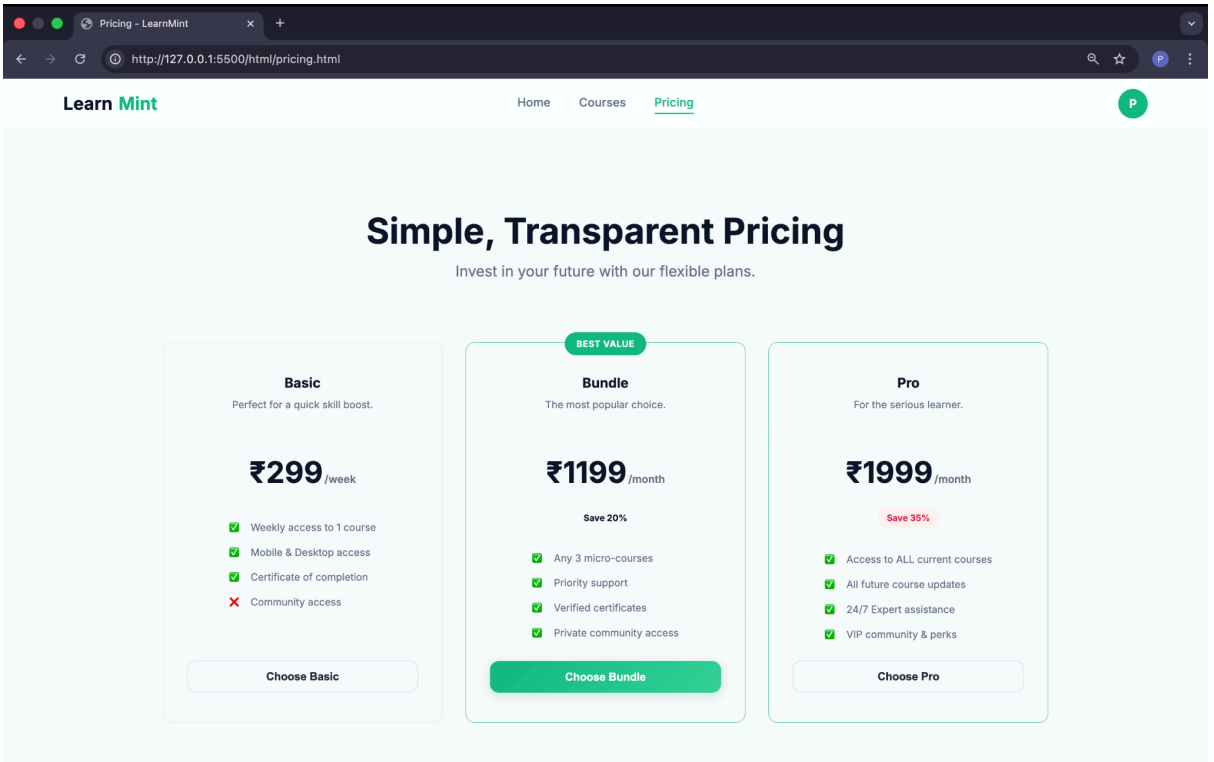
3. Course detail



4. Dashboard page



5. Pricing page



## 6. Problem Statement / Case Study Results and Conclusion.

### Results

The LearnMint website successfully demonstrates a simple micro-course marketplace platform. Users can explore courses, view course details, watch lesson videos, and track their progress through the dashboard.

The platform provides a structured learning experience where lessons are unlocked step by step. The progress bar visually shows how much of the course has been completed.

The responsive design allows the website to work on different screen sizes such as desktops, tablets, and mobile devices.

The project shows how HTML, CSS, and JavaScript can be used together to build an interactive multi-page website.

### Conclusion

This case study presents the development of **Learn Mint**, a micro-course marketplace website. The system allows users to browse courses, watch lessons, and monitor their learning progress.

The project demonstrates the use of semantic HTML structure, modern CSS layout techniques, and JavaScript functionality to create a responsive and interactive learning platform.

Overall, the system provides a basic but functional example of how a micro-learning platform can be designed using front-end web technologies.
